

TUBETRON

Quick Start Guide

1. IN: A standard 1/4"(TS) input jack.

2. OUT: A standard 1/4"(TS) output jack sending a mono output signal to whatever comes next in your signal chain.

3. POWER: The TUBETRON runs on a 9V DC power supply center negative, draw 15mA.

4. MIDDLE: Parametric mid control. Turning knob clockwise will shift mid-range "hump" into higher frequencies and will increase the edge or bite of the drive. Turning knob counter-clockwise will decrease mid-range "hump" and flatten EQ.

5. TREBLE: Parametric high control. Turning knob clockwise will brighten the sound. Turning knob counter-clockwise will darken the sound.

6. DRIVE: Controls amount of gain applied in drive stage. When fully turned counter-clockwise, the gain will be defeated and the effect may be used as a clean boost using level knob. When the knob is turned clockwise, the tone will become more saturated and harmonic overtones will become more present. **CAUTION:** Depending on the impedance level of the instrument, too much gain may cause a microphonic "squeal". Please use accordingly and do not scare your bandmates or the audience.

7. LEVEL: Controls the master output volume of the effected signal. As you increase LEVEL, decrease DRIVE to maintain an effected signal close to that of the bypassed signal.

8. EFFECT FOOTSWITCH: Determines whether the TUBETRON effect is engaged or bypassed.

- EFFECT LED:

When the green LED is OFF, the TUBETRON effect is bypassed.

When the green LED is ON, the TUBETRON effect is engaged.

Operating Instructions:

The Mu-Tron TUBETRON is an op-amp based overdrive effect which can be used as a transparent “clean boost” or as a “tube screamer on steroids”. The TUBETRON utilizes Mu-Tron’s patented opto-mod technology to create a “push-pull” type of parametric tone stack. It allows the pedal to be very flexible in terms of combinations between tone and gain. The TUBETRON sits well after wha and octave effects and before modulation, delay, and reverb. While the TUBETRON is designed to push the tubes on traditionally clean amps such as Fender blackface types, it can also push a Marshall into hyperdrive or even be used to “beef-up” the front end of sterile solid-state type amplifiers or mixing consoles. The TUBETRON has the same quality, ruggedness, and reliability that makes Mu-Tron the first choice of professional musicians.
